Rancho Cucamonga, CA 91730

Subject: **2009 SANBAG CMP Monitoring Existing Conditions Traffic Analysis – City of Rancho Cucamonga**

Dear Mr. Gillespie:

INTRODUCTION

Urban Crossroads, Inc. is pleased to submit this letter report documenting the Existing (2009) traffic counts and level of service calculations at twenty-one (21) intersections in the City of Rancho Cucamonga. The locations analyzed are shown on Exhibit A. The data presented in this letter report will be utilized to update the San Bernardino Associated Governments' (SANBAG) Congestion Management Program (CMP) monitoring database. The analysis methodology is followed by presentation of the analysis results.

METHODOLOGY

The analysis has been prepared in accordance with the procedures documented in the traffic study guidelines from the 2005 San Bernardino County CMP document. The current technical guide to the evaluation of traffic operations is the 2000 Highway Capacity Manual (HCM) (Transportation Research Board Special Report 209). The HCM defines level of service as a qualitative measure which describes operational conditions within a traffic stream, generally in terms of such factors as speed and travel time, freedom to maneuver, traffic interruptions, comfort and convenience, and safety. The criteria used to evaluate Level of Service (LOS) conditions vary based on the type of roadway and whether the traffic flow is considered interrupted or uninterrupted.

All of the CMP monitoring locations in the City of Rancho Cucamonga are signalized intersections. For signalized intersections, average total delay per vehicle for the overall intersection is used to determine

level of service. Levels of service at signalized study intersections have been evaluated using an HCM intersection analysis program (TRAFFIX, version 8.0). The levels of service are defined in terms of average delay for the intersection analysis methodology as follows:

LEVEL OF SERVICE	AVERAGE TOTAL DELAY PER VEHICLE (SECONDS)	
	SIGNALIZED	UNSIGNALIZED
A	0 to 10.00	0 to 10.00
B	10.01 to 20.00	10.01 to 15.00
C	20.01 to 35.00	15.01 to 25.00
D	35.01 to 55.00	25.01 to 35.00
E	55.01 to 80.00	35.01 to 50.00
F	80.01 and up	50.01 and up

Per the CMP, signalized intersections are considered deficient (LOS "F") if the overall intersection critical volume to capacity (V/C) ratio equals or exceeds 1.0, even if the level of service defined by the delay value is below the defined LOS standard. The V/C ratio is defined as the critical volumes divided by the intersection capacity. A V/C ratio greater than 1.0 implies an infinite queue.

The LOS analysis for signalized intersections has been performed using optimized signal timing. This analysis has included an assumed lost time of two seconds per phase. Signal timing optimization has considered pedestrian safety and signal coordination requirements. Appropriate time allowance for pedestrians has also been considered in the signalized intersection analysis. The following formula has been used to calculate the pedestrian minimum times for all HCM runs:

[(Curb to Curb distance) / (4 feet/second)] + 5 seconds

Saturation flow rates of 1,800 vehicles per hour of green (vphg) for through and right turn lanes, 1,700 vehicles for single left turn lanes, 1,600 vehicles per lane for dual left turn lanes and 1,500 vehicles per lane for triple left turn lanes have been assumed for all capacity analysis. A peak hour factor of 0.95 has been used in the analysis. These are the default values recommended by the CMP guidelines for existing conditions analysis.

EXISTING CONDITIONS TRAFFIC VOLUME AND GEOMETRIC DATA

Peak period traffic volume data has been collected at the 21 intersections previously presented on Exhibit A. The AM peak hour traffic volumes were determined by counting the two hour period between 7 – 9 AM in the morning. Similarly, the PM peak hour traffic volumes were identified by counting the two hour period from 4 - 6 PM in the evening. The count includes the vehicle classification as shown below per the requirements of the San Bernardino CMP.

- passenger cars (PCE factor = 1.0)
- buses/recreational vehicles (PCE factor = 1.5)
- 3 axles (PCE factor = 2.0)
- 4 or more axles (PCE factor = 3.0)

The overall existing count volumes illustrated on the exhibits and used for the analysis are calculated passenger car equivalent (PCE) volumes.

Daily traffic count data has also been collected at 7 locations, which are also shown on Exhibit A. Vehicle classification data has been collected for both the daily (24-hour) roadway segment and AM and PM peak period intersection turning movement counts. Attachment "A" contains the daily traffic volume data and Attachment "B" includes all of the peak period intersection turning movement count data.

Table 1 summarizes the daily traffic volume data, including the percentage of each type of vehicle. The daily vehicle volumes range between 20,190 vehicles per day (Base Line Road between Etiwanda Avenue and Shelby Place) and 58,436 vehicles per day (Foothill Boulevard between Day Creek Boulevard and the I-15 Freeway). The majority (between 73 and 76%) of the vehicular traffic is cars, with most of the

remainder (22-25%) consisting of larger 2-axle vehicles. Only 1-2% of the vehicles at any of the locations counted consist of vehicles with more than 2 axles.

The AM and PM peak period data has been further analyzed to determine the AM and PM peak hour volumes. The data has also been converted from raw vehicle counts to passenger car equivalent (PCE) volumes using the PCE factors described previously. The final AM and PM peak hour PCE turning movement volumes are shown on Exhibit B and Exhibit C, respectively.

Urban Crossroads, Inc. staff also performed field reconnaissance to obtain existing intersection geometric data and signal phasing information at each of the 21 intersection analysis locations. This data has been incorporated into the intersection operations analysis. The geometric data field notes are included as Attachment "C" of this letter report. The notes consist of intersection drawings depicting the number of lanes, curb-to-curb widths (for use in calculating minimum pedestrian crossing times), crosswalk locations, speed limits, and other data pertinent to the operations analysis (such as signal phasing). Per the CMP guidelines, a de facto right turn lane has been assumed (included in the analysis) wherever the outside (shoulder) through lane is 20 feet wide or more. The intersection geometric data is summarized on Exhibit D.

OPERATIONS ANALYSIS RESULTS

Existing peak hour traffic operations have been evaluated for both the AM and PM peak hours of traffic throughout the study area. The results of this analysis are summarized in Table 2, along with the existing intersection geometrics and control devices at each analysis location. As indicated in Table 2, the study area intersections currently operate at acceptable levels of service during the peak hours except the following intersection:

Etiwanda Avenue (NS) at:

- Arrow Route (EW)

The previous CMP monitoring cycle indicated that this intersection experienced acceptable traffic operations. Review of the previous analysis indicates that the northbound approach to this intersection

was analyzed including two through lanes. The current field reconnaissance, as well as review of aerial photography, indicates that only a single northbound through lane exists at this location.

The previous CMP monitoring cycle analysis also indicated that the intersection of Vineyard Avenue (NS) at Foothill Boulevard (EW) was experiencing deficient traffic operations. The underlying analysis has been reviewed and the current geometric configuration at this intersection includes an additional (2^{nd}) northbound through lane at this location, resulting in the improvement in peak hour traffic operations.

All other analysis location results have also been reviewed and appear reasonable. There are instances where traffic volumes have decreased over time. This is attributed to the current economic conditions and appears reasonable. A number of geometric differences are also evident in comparison to the previous analysis. Many of the differences are attributable to de facto right turn lanes, and all of the differences have been confirmed based upon review of the field notes and aerial photography. Even with the differences, the resulting levels of service are generally within one LOS of the previous monitoring report results.

CLOSING

Urban Crossroads, Inc. is pleased to provide this CMP monitoring analysis report for your use. If you have any questions or concerns regarding this analysis, please give us a call at (949) 660-1994.

Sincerely,

URBAN CROSSROADS, INC.

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; 1! = Left-Thru-Right Lane; 1> = Right Turn Overlap; 1>> = Free-Right Turn Lane

d = De Facto Right Turn Lane

[2] Delay and level of service calculated using the following analysis software: Traffix, Version 8.0 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal

[4] -- = Average Delay >100 or Critical Vol/Cap >1.0; Intersection Unstable; Level of Service "F".
